

# babi<sup>®</sup> robust

for a healthy start

Often piglet health is the limiting factor in weaning piglets, resulting in a high antibiotic use. Reducing the weaning-gap, and maintaining animal health is therefore crucial in piglet production when reducing antibiotic use. Certainly in environments with a high infection pressure and genetics with a high voluntary feed intake, promoting intestinal health in the weaning period is essential. For this reason, Nuscience developed the **Babi<sup>®</sup> Robust** feeding line.
